

DL 3155BRS system

DL 3155BRS-BAE

Kit for the study of analogue electronics

Composed of:

- Sub-module with BJT analysis of basic concepts
- Sub-module with BJT amplifier configuration
- Sub-module with BJT – Darlington configuration
- Sub-module with class A and class AB push-pull circuits
- Sub-module with operational amplifier
- Sub-module with power operational amplifier
- Sub-module with Schmitt trigger
- Sub-module with square/triangular waveforms generator
- Sub-module with 1st order high-pass/low-pass passive filters
- Sub-module with 1st order high-pass/low-pass active filters (operational amplifier differentiator and integrator)
- Sub-module with 2nd order high-pass/low-pass active filters
- Sub-module with JFET
- DL 3155BRS development module

Option:

- DL 2555ALF – Power supply ($\pm 5\text{Vdc}$, $\pm 15\text{Vdc}$ variable)

Necessary instrumentation: multimeter, function generator, oscilloscope

The kit is complete with theoretical and experiment manual.
